

Testimonial IPM after approval of stage 2 application (tests planned June – August 2020)

IPM - Intelligent Pollutant Monitoring is a Danish start-up founded in 2014 with the aim of implementing automatic monitoring of pollutants in the environment. It is a spinoff from the Department of Micro- and Nanotechnology at the Technical University of Denmark.

Test to be conducted through the Water Test Network innovation Voucher

The sensor system, CoPs (Continuous Pollution sensing), will be tested for nitrate and the herbicide bentazone in synthetic and natural water samples. CoPs performance will be validated according to the procedure of the International Organization for Standardization EN 17075:2018 « Water quality - General requirements and performance test procedures for water monitoring equipment - Measuring devices ». The results from WTN accredited third party (Brgm, France) will help IPM convince customers of CoPs' performance.

Why making use of a WTN voucher? What is the added value of WTN ?

With WTN, IPM will get a validation test from accredited party. This is a very needed step in order to convince potential customers to believe in the result output from this system. As this is a unique product, a trust story will have to be provided. In addition, the designed validation test will help IPM in optimizing the product, if needed, before sending it out for end users, this will allow us to enhance the overall experience for the final users.

"With the Water Test Network, we got a validation test from accredited party. This is a very needed step in order to convince potential customers to believe in the result output from this system. As this is a unique product, a trust story will have to be provided."
