

**RAWFILL** 

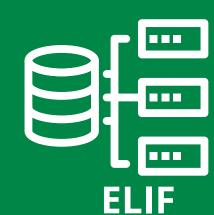

## The RAWFILL methodology

Landfill **Database** 

Adapt your database using ELIF

> (Enhanced Landfill **Inventory Framework**)

(Enhanced Landfill **Inventory Framework)** database structure

Method for gathering and storing Landfill mining and management oriented data sets in a structured way, for direct use and/or transfer to DSTs.

DST<sub>1</sub> (Decision Support Tool level 1): **CEDALION** 

DST level 1 prioritizes LFs based on limited, basic data sets. It allows to select LFs requiring additional information for further analysis with DST level 2.

**Innovative** LF content characterization

**Geophysics & Guided waste sampling** 

DST 2 (Decision Support Tool level 2): **ORION** 

After the collection of additional data, DST level 2 can determine which valorization options are the most suitable for the landfill. Ir addition, DST level 2 provides a link between the existing ELFM tools developed by other EU projects.

**ADVANTAGES OF GEOPHYSICS** 

- Non-invasive
- Detailed landfill content mapping
- Faster and cheaper than traditional landfill content characterization method
