CAMINO-2

Scaling shared automated vehicles for sustainable public transport

Imagine a public transport system that adapts to you: flexible and available on demand, 24/7, in both city centres and outskirts. This vision is becoming a reality: shared, fully electric, autonomous vehicles can provide a sustainable extension to public transport and help address driver shortages in North-West Europe.

CAMINO-2 is making this shift a reality. Through real-world living labs in Leuven, Paris, Hamburg, and Helmond, the project turns strategy into action: testing, learning, and scaling electric autonomous vehicle solutions that can be replicated by regions across Europe.
